USER INTERFACE DESIGN EX-6

RAD Model (Netflix UI-Based Application)

Introduction

RAD (Rapid Application Development) is a software development methodology that focuses on rapid prototyping and iterative delivery instead of long planning cycles. It is highly suitable for applications with strong UI/UX requirements, such as streaming platforms.

In this case study, RAD is applied to design a **Netflix-like mobile application**, emphasizing fast development, user feedback, and interactive UI design.

Key Characteristics of RAD

- Focus on prototypes rather than heavy documentation
- Continuous user involvement and feedback
- Fast development with iterative improvements
- Reusable UI components (e.g., cards, buttons, navigation bars)
- Ideal for UI-driven applications like streaming platforms

Phase 1: Requirements Planning

This phase defines system goals, user needs, and core features of the streaming application.

1) Identify Key Features

Navigation

- Splash Screen (Netflix logo)
- Login / Sign Up
- Home Screen
- Search Screen
- Content Categories
- User Profile

User Actions

- Sign in / Sign up
- Browse movies and series
- Search content
- View recommendations
- Continue watching
- Select and play content

2) Requirements Document

1. User should be able to log in or sign up
2. Display a home screen with featured content (e.g., banners like *Breaking Bad*)
3. Show "Continue Watching" section
4. Provide personalized recommendations
5. Enable search functionality for movies/series
6. Display categorized content (Popular, Trending, Documentaries)
7. Allow navigation using bottom menu (Home, Search, Downloads, Profile)

Phase 2: User Design

This phase focuses on UI/UX design and prototyping based on the uploaded screens.

1) Tools Used

- Figma (for UI design and prototyping)
- Axure (optional for interaction design)

2) Wireframes Designed

Splash Screen

- Netflix logo centered on black background
- "Login or Sign Up" button

Login Screen

- Email and Password input fields
- "Remember Me" checkbox
- "Forgot Password" option
- Sign-in button

Home Screen

- Featured banner (e.g., Breaking Bad)
- Continue Watching section
- Recommended for You section
- Scrollable content rows

Search Screen

- Search bar at top
- Sections:
    - Popular on Netflix
    - Trending Now
    - Documentaries

Navigation

- Bottom navigation bar:
    - Home
    - Search
    - Downloads
    - Profile

Design Considerations

- Dark theme UI for better viewing experience
- Card-based layout for content display
- Consistent typography and spacing
- Visual hierarchy for recommendations

Phase 3: Construction

In this phase, the prototype is developed and refined based on feedback.

1) Interactive Prototypes

- Navigation flow created:
    - Splash → Login → Home → Search → Content Browsing
- Clickable UI elements for realistic interaction

2) Dynamic Elements

- Scrollable content rows
- Animated transitions between screens
- Interactive buttons (Login, Search, Navigation tabs)
- Simulated media thumbnails

3) Testing and Iteration

- Prototype tested in Figma preview mode
- Feedback collected on:
    - UI clarity
    - Navigation ease
    - Content organization
- Improvements made:
    - Better spacing and alignment
    - Enhanced visibility of buttons
    - Improved search usability

Phase 4: Cutover

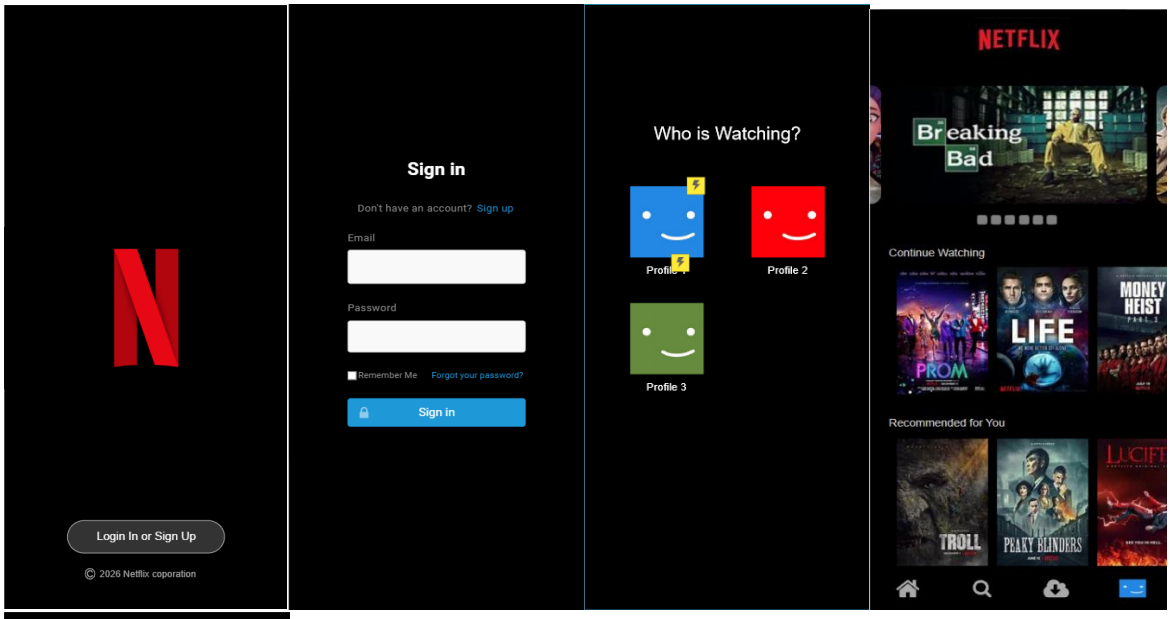
Final phase where the system is prepared for deployment.

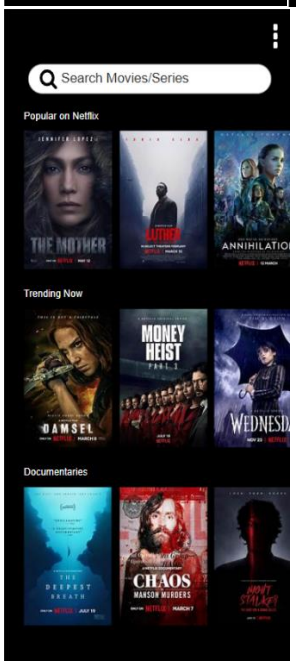
1) Finalization and Export

- Final UI shared via Figma
- Ready for developer handoff
- Can be exported to HTML/CSS or integrated into mobile frameworks

2) User Training & Support

- Walkthrough provided for stakeholders
- Documentation includes:
    - Screen flow
    - UI components
    - Navigation logic
- Collaboration enabled via design comments





Conclusion

Using the RAD model, the Netflix-style application was rapidly prototyped with continuous feedback and iterative improvements. The approach ensured:

- Faster development
- High-quality UI/UX
- User-centered design

This makes RAD highly effective for modern applications like streaming platforms.
